CS3216-07

IDE extension available for Visual Studio Code

A coding agent maps your repository into a diagram. **Every box opens the code it cites**, so you can review and learn what AI wrote.

Problems with AI workflows

PR review overload

2× review workload per reviewer in one enterprise study as AI adoption grew

AI generates changes faster than teams can review them. The pressure lands on the people who check what ships.

Comprehension debt

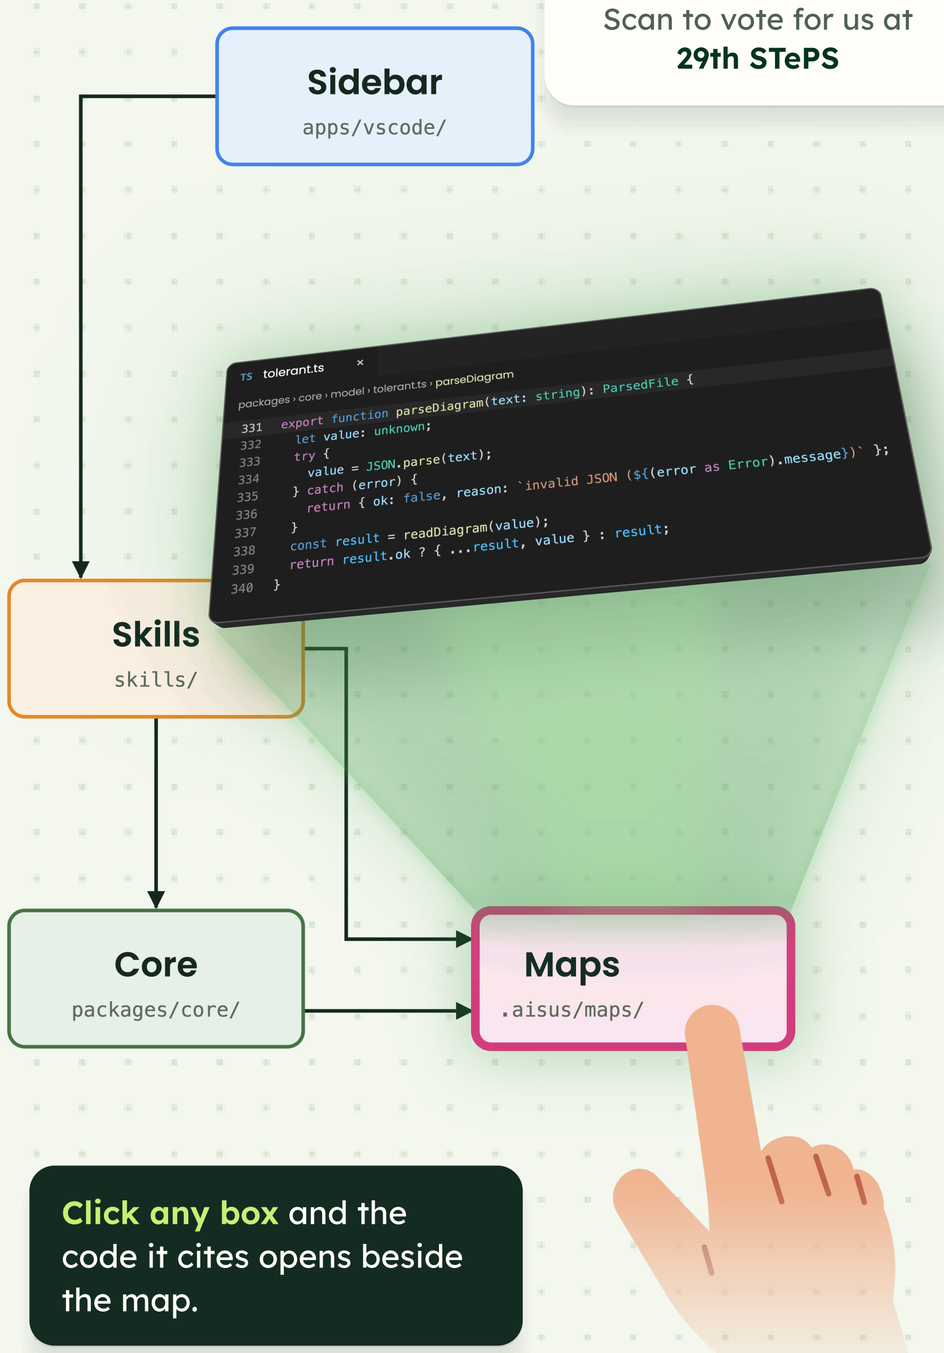

59% of surveyed developers used AI code they did not fully understand

Delegating unfamiliar tasks leaves developers with working code they **cannot explain or debug**.

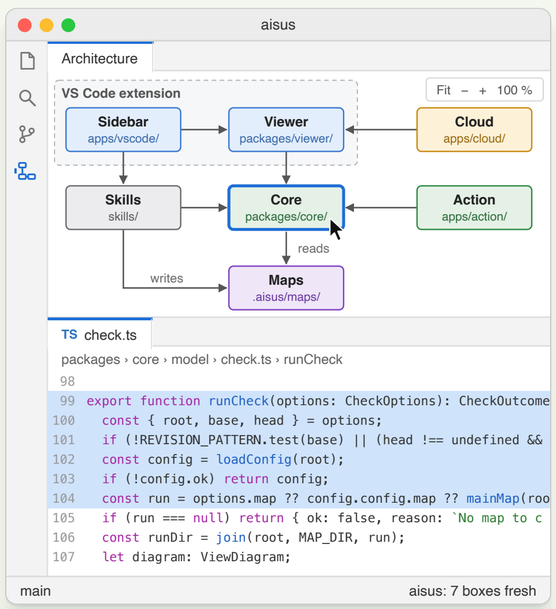

Lost in the codebase

You know what needs to change but not where to start. In an unfamiliar codebase, finding the relevant files and tracing how they connect can take **longer than writing the change**.

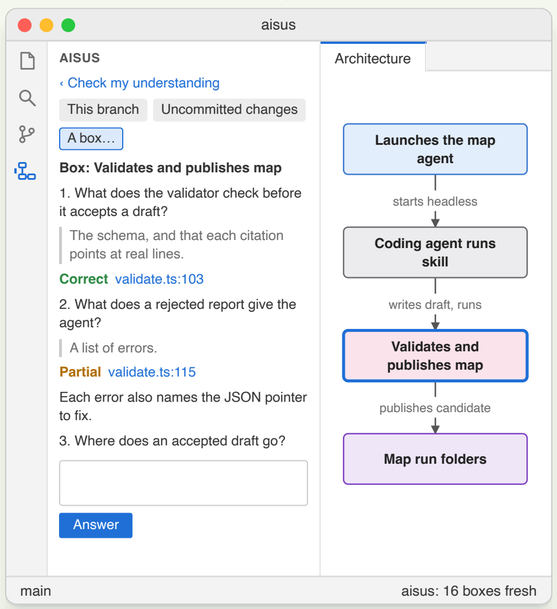

Onboarding a new hire costs effort, time and money. Developers start working effectively only once they have **an overall picture** of the system.

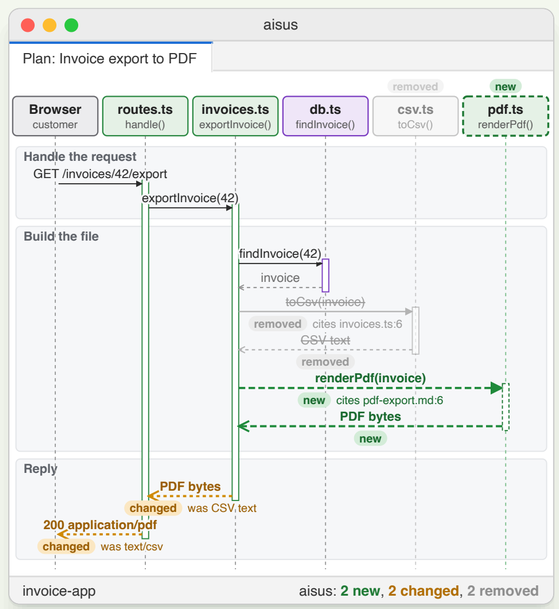

Visualizes your project & guides your learning

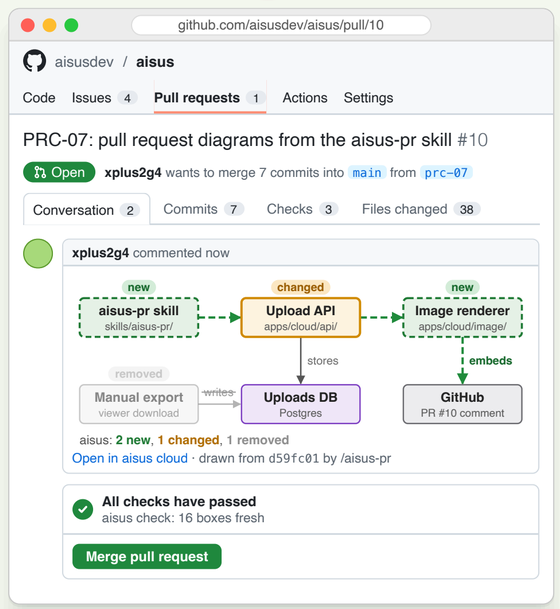

Interactive diagram

Learning the workflow

Visualize the changes

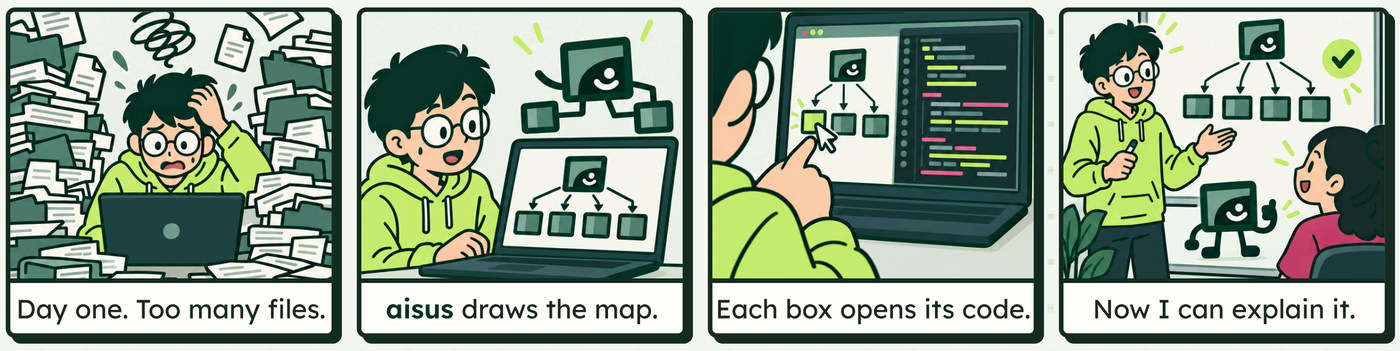

Share it with your team

Scenario study

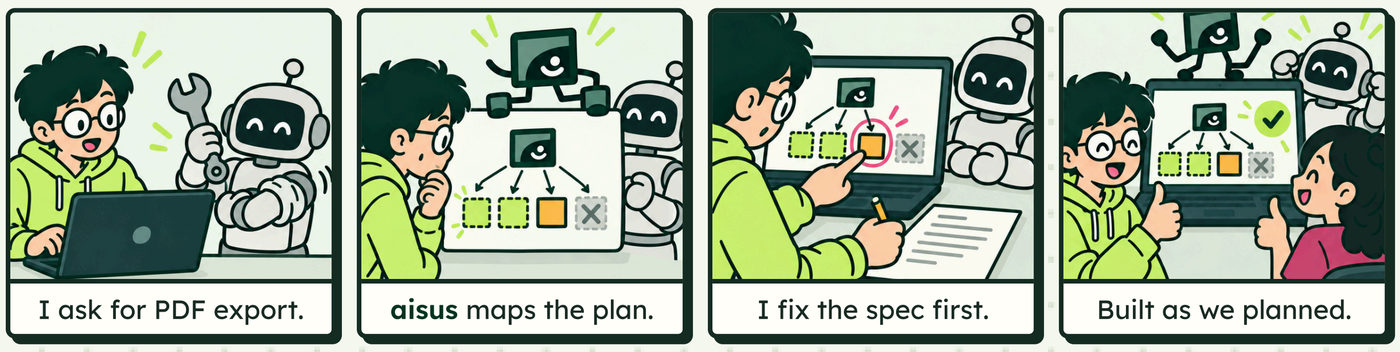

1 Learning a codebase

A new teammate wants **a picture of the whole system** before changing any of it.

2 See the impact before AI builds it

Before an agent writes code, see **what it will add, change and remove**.
